I[NTRODUCTION]{.smallcaps} {#sec1-1} ===== Cranial neuralgias are a group of clinical entities characterized by the sudden, severe, and focal pain that may be referred into the forehead, scalp, and face. Idiopathic trigeminal neuralgia (ITN) is the most common of these clinical conditions. \[[@ref1][@ref2]\] Here we report a case of ITN that was managed surgically and followed up for 16 months. C[ASE]{.smallcaps} R[EPORT]{.smallcaps} {#sec1-2}

===== A 45-year-old woman presented to us with a 10-year history of severe, pulsatile, paroxysmal pain in the left lateral aspect of the scalp and face that was aggravated by dental work, which was sharp and localized to the left maxillary third molar and had a frequency of about 10/min. Associated symptoms included a burning sensation and paraesthesia over the same site. The pain was aggravated by touching the molar. She had a family history of migraine. No eye or neck abnormalities were observed. She was non-depressed and anxious and denied any use of drugs or alcohol. Physical and neurological examinations were normal. Laboratory investigations and radiographs were all normal. At the first consultation, she was referred to the Department of Otorhinolaryngology of our hospital. She had been taking treatment at a private clinic without any response. Two months later, the patient was readmitted. After ruling out all causes of neuralgia except ITN, her family was advised to take her to a private clinic in Hong Kong. There, the patient had undergone 2 unsuccessful cauterizations of the affected molar area. It was suggested that she try to reduce the pain by changing her diet and by wearing a soft splint that would compress the molar area. She had no relief from these interventions. After 18 months of unsuccessful treatment at other institutions and with adverse effect of drugs, the patient was referred to us for management. An examination of the teeth showed the molar involved to be slightly 82157476af
